\textbf{ABSTRACT}

Reaction of methyl 2-aryl-5-(chlorosulfonyl)-1,3-oxazole-4-carboxylates with 1\textsubscript{H}-pyrazol-5-amines and 1\textsubscript{H}-1,2,4-triazol-5-amines proceeds with the participation of endocyclic aminoazole nitrogen atoms to yield products containing a primary amino group. Being treated by sodium hydride these products undergo a further transformation into the tricyclic compounds. It has been shown that the cyclocondensation pathway includes the Smiles rearrangement with extrusion of SO\textsubscript{2} followed by the elimination of MeOH. This reaction sequence is a convenient approach to the synthesis of new annulated [1,3]oxazolo[5,4-d]pyrimidine derivatives.

1. Introduction

Among a variety of pharmaceutically promising amides of azolesulfonic acids, oxazolesulfonyl amides seem to us particularly interesting. These species have the weakly aromatic oxazole ring capable to hydrolytic cleavage,\textsuperscript{1} which may be important for bioactivity associated with the enzyme inhibition. Thus, 1,3-oxazole-5-sulfonyl amide 1 (Fig. 1) is known to be a rare dual cyclooxygenase-2/5-lipoxygenase inhibitor.\textsuperscript{2}

\begin{figure}[h]
\centering
\includegraphics[width=0.8\textwidth]{fig1.png}
\caption{Biologically active 1,3-oxazole-5-sulfonyl amides}
\end{figure}
Other promising representatives of 1,3-oxazole-5-sulfonyl amides are those bearing a pronounced electron-withdrawing substituent at position C(4), in particular, compounds 2 and 3 obtained recently from the corresponding 1,5-oxazole 5-sulfonyl chlorides in our laboratory.\textsuperscript{3,4} One of our research tasks was entering into the sulfonyamide group of 2 and 3 an electron-deficient heterocyclic substituent R\textsuperscript{2}, which increases the acidity of the N—H linkage making a molecule to be easier delivered to the target enzyme like that in the case of the sulfanilamide drugs.\textsuperscript{5} Recently we reported that the interaction of 4-cyano-1,3-oxazole-5-sulfonyl chlorides with 1H-pyrazol-5-amines and 1H-1,2,4-triazol-5-amine leads to unexpected substitution products, which, nevertheless, are useful for further heterocyclization.\textsuperscript{6}

The aim of the present work was to investigate into products of interaction of 1,3-oxazole-5-sulfonyl chlorides having a methoxycarbonyl group at position C(4) with the aforementioned heterocyclic amines.

2. Results and Discussion

Methyl 2-aryl-5-(chlorosulfonyl)-1,3-oxazole-4-carboxylates 4 were treated with commercially available 1H-pyrazol-5-amines 5 and 1H-1,2,4-triazol-5-amines 6 in the conditions shown in Scheme 1.

Despite the fact that a very similar analogy was reported with this reaction,\textsuperscript{6} its result requires careful consideration because both endo- and exocyclic aminoazole nitrogen atoms can take part. It is known, for example, that 3-methyl-1H-pyrazol-5-amine as well as 3-methyl-1H-1,2,4-triazol-5-amine react with aromatic sulfonyl chlorides to give mixtures of sulfonyl derivatives.\textsuperscript{7,8} Nevertheless, the reaction of 4 with 5 and 6 in the presence of triethylamine proceeded quite regioselectively with 76-84% yield of endo-substitution products 7 and 8. The fact that compounds 7 and 8 contain a primary amino group is confirmed by i) two characteristic IR absorption bands relevant to the asymmetric and symmetric N—H stretching from 3500-3200 cm\textsuperscript{-1}, ii) a two proton NMR singlet at 6.5 ppm (for 7) and within 7.8-7.5 ppm (for 8). X-ray crystal analysis of 7c and 8b was also carried out, which revealed their additional structural stabilization due to an intramolecular NH\textsubscript{2}···O:S hydrogen bond (Fig. 2 and Fig. 3).

![Fig. 2. ORTEP diagram of solvate 7c·MeCN with 50% ellipsoids probability](image-url)
In molecule 7c, the 1,3-oxazole and the pyrazole ring mean planes make a dihedral angle of 80.60(9)°. Benzene ring C(4)-C(9) and the CO₂Me group are rotated relative to the 1,3-oxazole ring by 13.67(15) and 29.75(16)°, respectively. Intramolecular N(4)H···O(5) hydrogen bond was found with the following parameters N(4)···H 0.83(3) Å, N(4)···O(5) 2.807(3) Å, N(4)HO(5) 133(2)°.

![Fig. 3. ORTEP diagram of solvate 8b MeCN with 50 % ellipsoids probability](image)

In molecule 8b, the 1,3-oxazole and the triazole ring mean planes make a dihedral angle of 77.26(10)°. The benzene ring is almost coplanar with the 1,3-oxazole ring and the ester group is slightly rotated so that dihedral angles between the corresponding planes are 2.7 (1)° and 9.0 (1)°. Both intramolecular N(5)H···O(5) N(5)···H 0.85(5) Å, N(5)···O(5) 2.832(4) Å, N(5)HO(5) 127(4)° and intermolecular N(5)H···N(4′) hydrogen bonds were found in a crystal.

Our recent investigations showed that analogues of products 7 and 8 bearing a CN group instead of CO₂Me at C(4) of the 1,3-oxazole ring when treated by sodium hydride undergo a transformation into tricyclic compounds. Scheme 2 demonstrates how compounds 7 and 8 have been involved in a similar cyclocondensation to provide fused heterocycles 9 and 10.

![Scheme 2. Formation of compounds 9 and 10](image)

As for the mechanism, anion-intermediates A-D are conceived, from which sequence A-C is a new example of the N – S Smiles rearrangement with the sulfur dioxide extrusion.

Products 9 and 10 were obtained in 60-75% yield and are very high melted and poorly soluble solids. Their structure was verified by the spectral data, among which it is worth mentioning the strong IR absorption in the region 1680-1720 cm⁻¹ attributed to C=O bond vibration. This characteristic allows excluding the existence of 9 and 10 in the OH tautomer form in the solid state. However, they can exist in different NH tautomer forms (9, 9’ and 10, 10’, 10”). X-ray diffraction study of compound 10c showed that the [1,3]oxazolo[5,4-d][1,2,4]triazolo[1,5-a]pyrimidin-9(5H)-one structure 10” takes place in a crystal (Fig. 4). We did not study the tautomerism in a solution. In the ¹H NMR spectra of 9...
and 10 dissolved in DMSO-\textit{d}$_{6}$, the NH signal was not detected but multiplets analysis indicated the presence of the only tautomer.

![Scheme 3](image)

**Scheme 3.** Preparation of compounds 11 and their transformation into 9. Reagents and conditions: (a) NaH, THF, 50-60 °C; (b) HCl / H$_2$O, rt.

This observation along with the above crystallographic evidence supports the cyclocondensation pathway shown in **Scheme 2** and doubts on the alternative possibility depicted in **Scheme 4**.

![Scheme 4](image)

**Scheme 4.** An alternative cyclocondensation pathway

Theoretically anions A could eliminate MeOH to give 7 membered cyclic intermediates E. An analogy of this cyclization has been reported.\textsuperscript{10} Anions E could undergo ring contraction to give anions F. The protonation of the latter could lead to the angular regioisomers of tricyclic compounds 8 and 9, which in fact were not found during the experiment.

3. Conclusion

In conclusion, described in the article cyclocondensation reaction of esters 7 and 8 under the action of NaH the Smiles rearrangement with extrusion of SO$_2$ does occur followed by the elimination of MeOH. This reaction sequence is a convenient approach to the synthesis of new “\textit{a}” annulated [1,3]oxazolo[5,4-\textit{d}]pyrimidine derivatives.

4. Experimental

4.1. Instruments, Reagents, and Methods

Melting points were determined on a Fisher-Johns apparatus. IR spectra were recorded on a Vertex-70 spectrometer from KBr pellets. $^1$H and $^{13}$C NMR spectra were recorded on Varian Mercury 400 (400 and 100 MHz, respectively) and Bruker Avance DRX 500 (500 and 125 MHz, respectively) spectrometers in DMSO-$d_6$. $^{13}$C NMR spectra were obtained for most new compounds, except for 9a-c and 10a,b because of their poor solubility. LC-MS analysis was performed on an Agilent 1200 Series system equipped with a diode array and a G6130A mass-spectrometer (atmospheric pressure electrospray ionization). Combustion elemental analysis was performed in the Institute of Bioorganic Chemistry and Petrochemistry analytical laboratory.

Crystallographic measurements were performed on a Bruker Smart Apex II diffractometer operating in the $\omega$ scan mode using Mo-K$_\alpha$ radiation with $\lambda = 0.71078$ Å. Structures were solved by direct methods and refined by the full-matrix least-squares technique in the anisotropic approximation for non-hydrogen atoms using the Bruker SHELXTL program package. The carbon-linked hydrogen atoms were placed at calculated positions and refined as a “riding” model, the other hydrogen atoms were located in DF synthesis and refined isotropically. Crystallographic data (excluding structure factors) for the structures in this paper have been deposited with the Cambridge Crystallographic Data Centre as supplementary publication numbers CCDC1834792, CCDC1834794, and CCDC1834796. Copies of the data can be obtained, free of charge, on application to CCDC, 12 Union Road, Cambridge CB2 1EZ, UK, (fax: +44-(0)1223-336033 or e-mail: deposit@ccdc.cam.ac.uk).

Methyl 2-aryl-5-(chlorosulfonyl)-1,3-oxazole-4-carboxylates 4 were prepared according to the published method. 1H-Pyrazol-5-amines 5 and 1H-1,2,4-triazol-5-amines 6 were supplied by Enamine Ltd, Kiev.

Compounds 9 have been arbitrarily named as [1,3]oxazolo[5,4-d]pyrazolo[1,5-a]pyrimidin-9(4H)-one tautomers but compounds 10 – as [1,3]oxazolo[5,4-d][1,2,4]triazolo[1,5-a]pyrimidin-9(5H)-one tautomers taking into account the X-ray analysis.

4.2. Experimental procedure and physical data for compounds 7 and 8

Compound 4 (4 mmol) was added to a solution of heterocyclic amine 5 or 6 (4 mmol) and Et$_3$N (4 mmol) in anhydrous dioxane (15 mL), this composition was refluxed for 2 h. The resulting mixture was cooled to 20–25 °C, the precipitate was filtered off, and the filtrate was evaporated in vacuum. The residue was triturated with water to give a crude product which was separated, recrystallized from MeCN, and dried at 70-80 °C.

4.3. Experimental procedure and physical data for compounds 9

To a solution of compound 7 or 11 (1 mmol) in anhydrous THF (15 mL), 80 mg of 60% NaH (2 mmol) was added. The reaction mixture was stirred at 20-25 °C for 1 h then heated at 50-60 °C for 2 h, cooled to room temperature, diluted with water (20 mL), and acidified by the concd hydrochloric acid (0.2 mL). The precipitate formed was filtered off, recrystallized from DMF/MeCN (1:1), and dried at 70-80 °C to give the analytically pure product.

2,6-Diphenyl[1,3]oxazole[5,4-d]pyrazolo[1,5-a]pyrimidin-9(4H)-one (9a)

Colorless solid; 67% yield; mp above 300 °C. IR, ν, cm⁻¹: 3400-2650 (NH, CH), 1689 (C=O). ¹H NMR (400 MHz), δ: 8.06-8.04 (m, 4H, ArH), 7.58-7.52 (m, 6H, ArH), 6.95 (s, 1H, CH). MS, m/z: 329 [M+1]. Anal. calcd for C₁₉H₁₂N₄O₂: C, 69.51; H, 3.68; N, 17.06. Found: C, 69.60; H, 3.66; N, 17.18.

6-(4-Methylphenyl)-2-phenyl[1,3]oxazole[5,4-d]pyrazolo[1,5-a]pyrimidin-9(4H)-one (9b)

Colorless solid; 63% (from 7b), 72% (from 11b) yield; mp above 300 °C. IR, ν, cm⁻¹: 3295 (NH), 1689 (C=O). ¹H NMR (400 MHz), δ: 8.09-8.07 (m, 2H, ArH), 7.96-7.95 (m, 2H, ArH), 7.59 (s, 3H, ArH), 7.36-7.34 (m, 2H, ArH), 6.91 (s, 1H, CH), 2.39 (s, 3H, CH₃). MS, m/z: 343 [M+1]. Anal. calcd for C₂₀H₁₄N₄O₂: C, 70.17; H, 4.12; N, 16.36. Found: C, 70.11; H, 4.12; N, 16.31.

2-(4-Methylphenyl)-6-phenyl[1,3]oxazole[5,4-d]pyrazolo[1,5-a]pyrimidin-9(4H)-one (9c)

Light yellow solid; 62% (from 7e), 69% (from 11c) yield; mp above 300 °C. IR, ν, cm⁻¹: 3321 (NH), 1684 (C=O). ¹H NMR (400 MHz), δ: 8.06-7.95 (m, 4H, ArH), 7.54-7.40 (m, 5H, ArH), 6.95 (s, 1H, CH), 2.41 (s, 3H, CH₃). MS, m/z: 343 [M+1]. Anal. calcd for C₂₀H₁₄N₄O₂: C, 70.17; H, 4.12; N, 16.36. Found: C, 70.20; H, 4.10; N, 16.23.

4.4. Experimental procedure and physical data for compounds 10

To a solution of compound 8 (1 mmol) in anhydrous THF (15 mL), 80 mg of 60% NaH (2 mmol) was added. The reaction mixture was stirred at 20-25 °C for 1 h then heated at 50-60 °C for 2 h, cooled to room temperature, diluted with water (20 mL), and acidified by the concd hydrochloric acid (0.2 mL). The precipitate formed was filtered off, recrystallized from DMF/MeCN (1:1), and dried at 70-80 °C to give the analytically pure product.
2,6-Diphenyl[1,3]oxazolo[5,4-d][1,2,4]triazolo[1,5-a]pyrimidin-9(5H)-one (10a)

Colorless solid; 70% yield; mp above 300 °C. IR, ν, cm⁻¹: 3290 (NH), 1684 (C=O). ¹H NMR (400 MHz), δ: 8.11-8.07 (m, 4H, ArH), 7.64-7.58 (m, 6H, ArH). MS, m/z: 330 [M+H]+. Anal. calcd for C₁₉H₁₁N₂O₂: C, 65.65; H, 3.73; N, 21.27. Found: C, 65.70; H, 3.36; N, 21.41.

2-(4-Methylphenyl)[1,3]oxazolo[5,4-d][1,2,4]triazolo[1,5-a]pyrimidin-9(5H)-one (10b)

Colorless solid; 60% yield; mp above 300 °C. IR, ν, cm⁻¹: 3370-2640 (NH, CH), 1724 (C=O). ¹H NMR (400 MHz), δ: 8.86 (s, 1H, CH), 7.96 (d, J = 7.2 Hz, 2H, ArH), 7.40 (d, J = 7.2 Hz, 2H, ArH), 2.40 (s, 3H, CH₃). MS, m/z: 269 [M+H]+. Anal. calcd for C₁₃H₁₀N₂O: C, 66.47; H, 3.82; N, 20.40. Found: C, 66.50; H, 3.79; N, 20.28.

Crystallographic data for compound 10c

C₁₉H₁₂N₂O₂·C₃H₇NO, M = 416.44. Crystal size ca 0.13x0.25x0.31mm, triclinic, space group P-1, a = 7.606(3), b = 11.748(4), c = 12.175(4) Å, α = 93.747(10), β = 100.826(9), γ = 106.889(8)°. V = 1014.2(5) Å³, Z = 2, d = 1.364 g·cm⁻³, μ = 0.095 mm⁻¹, F(000) = 436. Intensities were measured at room temperature within θ_max ≤ 26.54° (14299 reflections total, 4184 unique reflections, Rmerge = 0.061). The convergence was obtained at R1 = 0.053, wR2 = 0.105 for 2166 observed reflections with I ≥ 2σ(I) and at R1 = 0.1256, wR2 = 0.1318, GOF = 1.002 for 4184 independent reflections, 288 parameters, the maximum and minimum peaks on the final difference map correspond to 0.19 and −0.19 e/Å³.

4.5. Experimental procedure and physical data for compounds 11

To a solution of one of compounds 7b,c (1 mmol) in anhydrous THF (15 mL), 80 mg of 60% NaH (2 mmol) was added. The reaction mixture was stirred at 20-25 °C for 1 h then heated at 50-60 °C for 30 min, cooled to room temperature, diluted with water (20 mL), and acidified by the concd hydrochloric acid (0.2 mL). The precipitated product was filtered off, recrystallized from MeCN, and dried at 70-80 °C.

Methyl 5-((3-(4-methylphenyl)-1H-pyrazol-5-yl)amino)-2-phenyl-1,3-oxazole-4-carboxylate (11b)

Colorless solid; 62% yield; mp 278-280 °C. IR, ν, cm⁻¹: 3295 (NH), 1689 (C=O). ¹H NMR (400 MHz), δ: 12.99 (s, 1H, NH), 9.37 (s, 1H, NH), 7.90 (d, J = 8.0 Hz, 2H, ArH), 7.69 (d, J = 8.4 Hz, 2H, ArH), 7.55-7.47 (m, 3H, ArH), 7.29 (d, J = 7.2 Hz, 2H, ArH), 6.70 (s, 1H, CH), 3.83 (s, 3H, CH₃O), 2.35 (s, 3H, CH₃C). ¹³C NMR (125 MHz), δ: 162.5, 150.2, 130.1, 129.5, 129.2, 126.2, 125.2, 125.1, 105.9, 92.9, 51.0, 20.9. MS, m/z: 375 [M+H]+. Anal. calcd for C₂₁H₁₆N₄O₃: C, 67.37; H, 4.85; N, 14.96. Found: C, 67.44; H, 4.91; N, 14.83.

Methyl 2-(4-methylphenyl)-5-((3-phenyl-1H-pyrazol-5-yl)amino)-1,3-oxazole-4-carboxylate (11c)

Colorless solid; 65% yield; mp 289-291 °C. IR, ν, cm⁻¹: 3321 (NH), 1677 (C=O). ¹H NMR (400 MHz), δ: 13.06 (s, 1H, NH), 9.38 (s, 1H, NH), 7.80-7.78 (m, 4H, ArH), 7.50-7.33 (m, 5H, ArH), 6.73 (s, 1H, CH), 3.82 (s, 3H, CH₃O), 2.36 (s, 3H, CH₃C). ¹³C NMR (125 MHz), δ: 162.5, 155.0, 150.5,
139.9, 129.7, 129.0, 128.3, 125.2, 125.1, 123.6, 105.9, 93.1, 51.0, 21.0. MS, $m/z$: 375 [M+1]$^+$. Anal. calcd for C$_{21}$H$_{18}$N$_4$O$_3$: C, 67.37; H, 4.85; N, 14.96. Found: C, 67.40; H, 4.80; N, 14.81.
