**ABSTRACT**

Home appliances are among basic requirements of anyone in the world and it is always important to find out about factors influencing this industry. Therefore, the purpose of this study is to provide a comprehensive model to detect major factors influencing on consumer purchasing intention. For this purpose, the proposed study designs a questionnaire and distributes it among 400 customers who have some experiences on purchasing home appliances in city of Tehran, Iran, recently. Cronbach alpha was calculated for all components of the survey and they were all well above the minimum acceptable level. We analyzed the data using structural equation modeling via LISREL and the results of this survey show that brand familiarity, brand trust, and perceived value have significant positive effects on consumers purchase intention.

1. Introduction

Home appliances are among basic requirements of anyone in the world and it is always important to find out about factors influencing this industry (Peter & Tarpey 1975; Grönroos, 1997; Sheth et al., 1991; Sweeney & Soutar, 2001). Ahmed and d’Astous (1996), for instance performed a survey on producers’ country of origin as an influencing factor and reported that the combined effects of country of design and country of assembly cues had a stronger effect than brand name on consumer evaluation of quality and purchase value of automobiles on some goods like VCRs and shoes. In their survey, magnitude of a priori cue differentiation played a strong role in product evaluation and country-of-origin cues was considerably modified when a consumer was provided with additional product-related information. Ahmed and d’Astous (2008) performed another investigation on country of origin and concluded that this is an important issue on purchasing products and services.

Babin et al. (1994) explained the development of a scale measuring both values obtained from the pervasive consumption experience of shopping. They developed and validated the scale using a multistep process and the results demonstrated that distinct hedonic and utilitarian shopping value dimensions existed and were associated with a number of important consumption variables. Campbell and Keller (2003) explained based on television ads and computer Internet ads that brand familiarity could impact repetition effectiveness. More specifically, repetition of advertising attributed to an unfamiliar brand demonstrated decreased effectiveness; when the same advertising was attributed to a known, familiar brand, repetition wearout was put off.

Viot (2012) demonstrated that consumers’ expertise of a product affects the number of attributes considered as vital, the importance given to the attributes as well as the size and the content of the consideration set (CS). The study stated that the attributes considered as important by the novices differ from those considered important by the experts. Chen and Barnes (2007) examined consumers' online initial trust by implementing four major groups of determinants including perceived technology, perceived risk, company competency, and trust propensity. They also investigated the effects of both online initial trust and familiarity with online purchasing on purchase intention. The study was statistically examined based on the web sites of four online bookstores in Taiwan. They reported that perceived usefulness, perceived security, perceived privacy, perceived good reputation, and willingness to customize were the important antecedents to online initial trust.

Kim et al. (2008) demonstrated that Internet consumers' trust and perceived risk had strong effects on their purchasing decisions. Consumer disposition to trust, reputation, privacy concerns, security concerns, the information quality of the Website, and the company's reputation, had strong impacts on Internet consumers' trust in the Website. Kuo (2009) investigated the relationships among service quality, perceived value, customer satisfaction, and post-purchase intention in mobile value-added services. They reported that service quality positively influenced both perceived value and customer satisfaction and perceived value positively impacted on both customer satisfaction and post-purchase intention.

This paper provides a comprehensive model to detect major factors influencing on consumer purchasing intention.
2. The proposed study

In this paper, we present a study to detect important factors impacting consumer purchasing intention. The proposed study uses the following framework to examine different hypotheses.

\[
N = Z_{\alpha/2}^2 \frac{p \times q}{\varepsilon^2},
\]

where \( N \) is the sample size, \( p = 1 - q \) represents the probability, \( z_{\alpha/2} \) is CDF of normal distribution and finally \( \varepsilon \) is the error term. For our study we assume \( p = 0.5, z_{\alpha/2} = 1.96 \) and \( \varepsilon = 0.99 \), the number of sample size is calculated as \( N = 384 \). The proposed study selects 400 customers who made some purchases from home appliances stores during the year of 2012. Structural equation modeling has been performed to detect important factors influencing purchasing intention including perception value (PV), perception risk (PR), trust to brand (TB) and brand familiarity (BF). There are four hypotheses associated with the proposed study of this paper as follows,

1. Brand familiarity positively influences on purchasing intention.
2. Perception risk positively influences on purchasing intention.
3. Perception value positively influences on purchasing intention.
4. Trust to brand positively influences on purchasing intention.

Cronbach alphas have been calculated for these four mentioned items were well above 0.80, which validated the overall questionnaire of the survey. Table shows details of Cronbach alpha in preliminary and final stages.
### Table 1
The summary of Cronbach alpha

The proposed study of this paper uses structural equation modeling to verify different hypotheses of this survey.

Fig. 2 shows personal characteristics of the participants. In this study, 48.1% of the participants were male while 51.9% were female. In terms of age, 29% of the participants aged 30 years or less, 31.1% of them aged between 30 and 40 years, 25.8% of them were 40-50 years old and 14.1% of the were older than 50.

#### 3. The results

In this section, we present details of our findings on testing four hypotheses of this paper. Fig. 2 shows details of the results of structural equation modeling.
As we can observe from the results of Fig. 2, all four components have positive impacts on compulsive buying when the level of significance is five percent. Table 2 shows details of our results. The results of Table 2 confirm that all coefficients are statistically significance with $\alpha = 5\%$.

### 4. Discussion and conclusion

In this paper, we have presented an empirical investigation to study the effects of different factors on purchasing intention in different home appliances stores located in city of Tehran, Iran. The proposed study designed a questionnaire and examined the impacts of brand familiarity, trust to brand, perception value and perception risk on purchasing intention based on the implementation of structural equation modeling. The results of our survey have confirmed that three independent variables, including brand familiarity, trust to brand and perception value influenced positively on purchasing intention, significantly. However, our survey did not provide any supportive relationship between perception risk and purchasing intention.
